

Titanic shipwreck

- The titanic dataset was analysed to provide insights into the passengers' demographics, embarkation points, survival rates, and other variables using **PowerBI**.
- In this project, I categorised **passengers by age**, created measures for counting survivors and non-survivors, and summarised total fares. Interactive visualisations such as, **Cards**, **Pie chart**, **Stacked Column Charts**, and **scatter plots** were used to display these insights, with added slicers for dynamic data filtering by variables like Passenger Class, Sex, Age Categories, Survival Status.
